ASSIGNMENT 3

The main goal of this assignment is the creation of sitemap for your project and usage of any relevant API

TASKS TO BE DONE:

- 1) Think for a moment and then start googling any API that will be relevant for your web application (for example, an API for getting exchange rates if you are doing an online store, etc.). In case there is no corresponding API, choose something neutral (pulling of a weather or whatever)
- 2) You have to draw a sitemap for your web application. While building a sitemap, you should consider the number of clicks your users will do, the number of choices they will have. Less clicking – benefit of user experience. You may use any drawing tool. Here given an example (online food delivery website)

P.S. draw a sitemap only for guest/user role, without showing pages available for admins
